

# Measurement and Analysis of Hajime: a Peer-to-peer IoT Botnet

*Stephen Herwig*

Katura Harvey

George Hughey

Richard Roberts

Dave Levin

University of Maryland

+ The Max Planck Institute  
for Software Systems

# Rise of IoT Botnets

Hajime

Resilient C&C

Targets many CPU arches

Scanning behavior arch-specific

Continuously deploys new exploits

# Talk Overview

**Describe** Hajime P2P network  
Our measurement infrastructure

**Analyze** Heterogeneous botnet composition  
Impact of three exploit deployments

**Discuss** Challenges of new, resilient botnets

# BitTorrent's P2P Network

IP reassignment overcounts bots based on IPs

10,536,174 total keys found

# Datasets

Jan 25, 2018 – Jun 1, 2018

## DHT scans

**5,404,045**  
unique IP addresses

## Key scans

**10,536,174**  
unique keys

## Reverse eng

**47 modules**  
**34 .atk, 13 .i**

All available at [iot.cs.umd.edu](http://iot.cs.umd.edu)

# Analysis Questions

## Characteristics

How large is the botnet?

Where are bots located?

What devices makeup the botnet?

## Dynamics

How do exploits change the botnet?

How quickly does Hajime update itself?

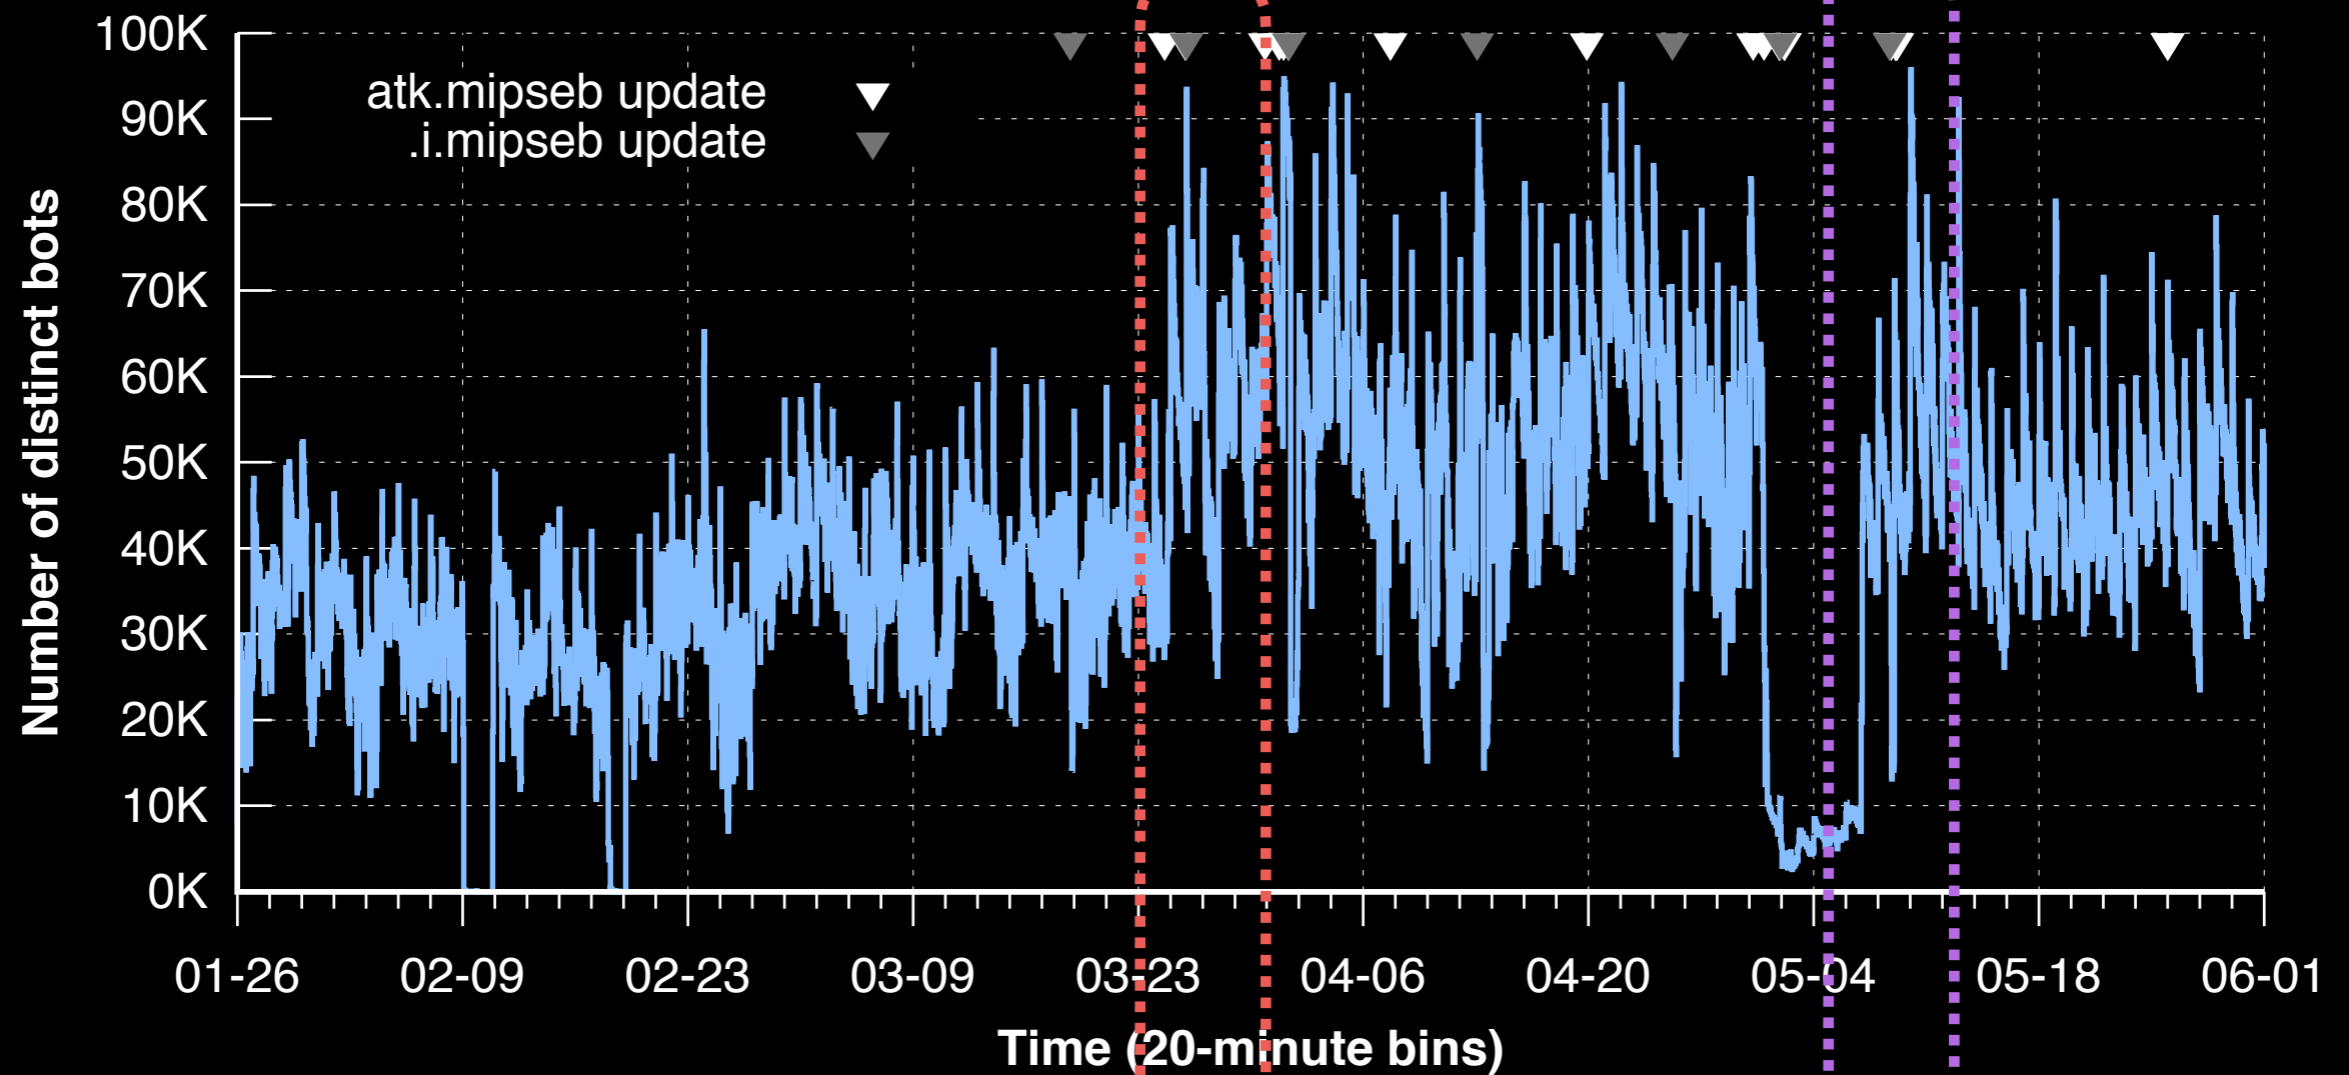

How does Hajime deploy new exploits?

# How big is Hajime?

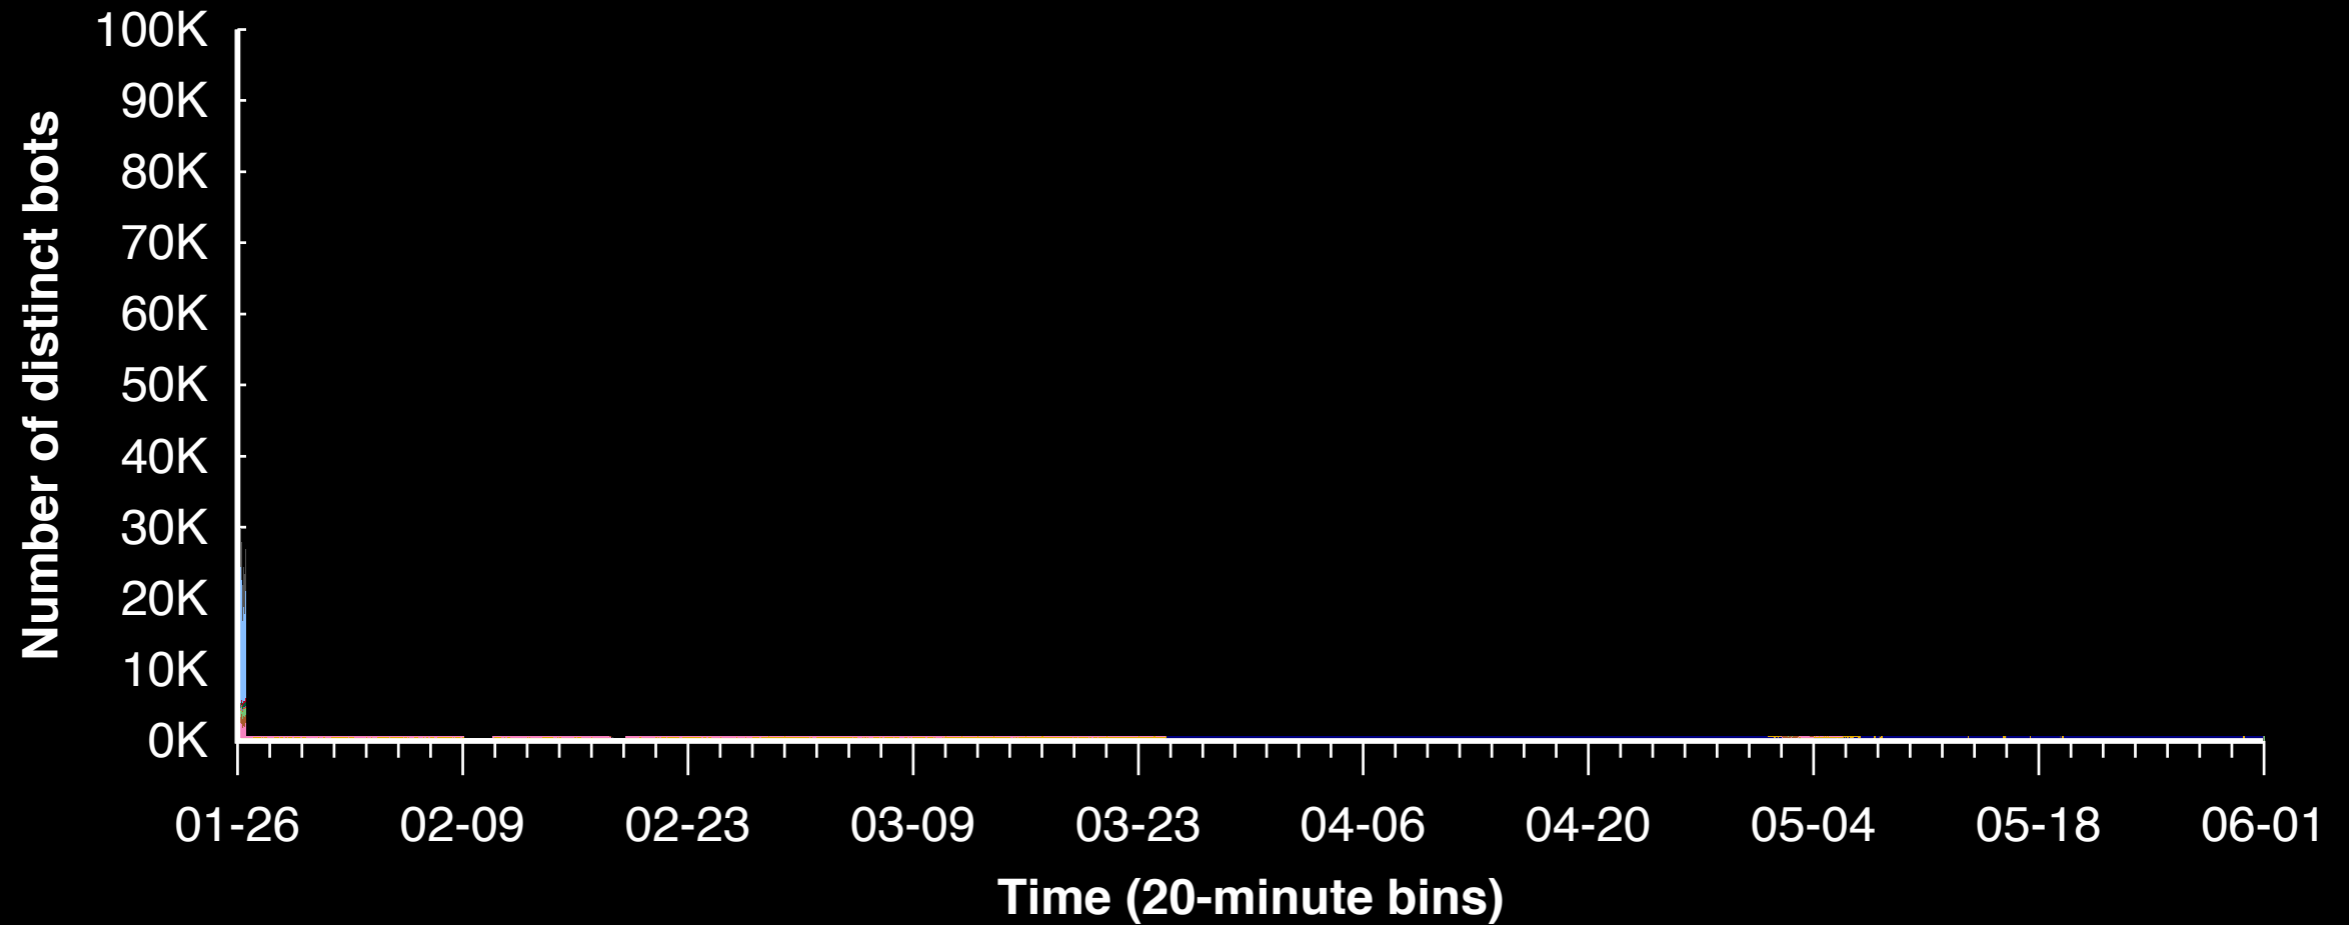

# How big is Hajime?

Peaks of **95K** after **Chimay-Red** and **GPON** exploits

Steady-state of **~40K** bots

# Where are bots located?

# Where are bots located?

**Chimay-Red**

Russia expanded  
500 → 6,000 hourly

The geographic makeup of IoT botnets can change rapidly

# Where are bots located?

**Chimay-Red**

Russia expanded  
500 → 6,000 hourly

**GPON**

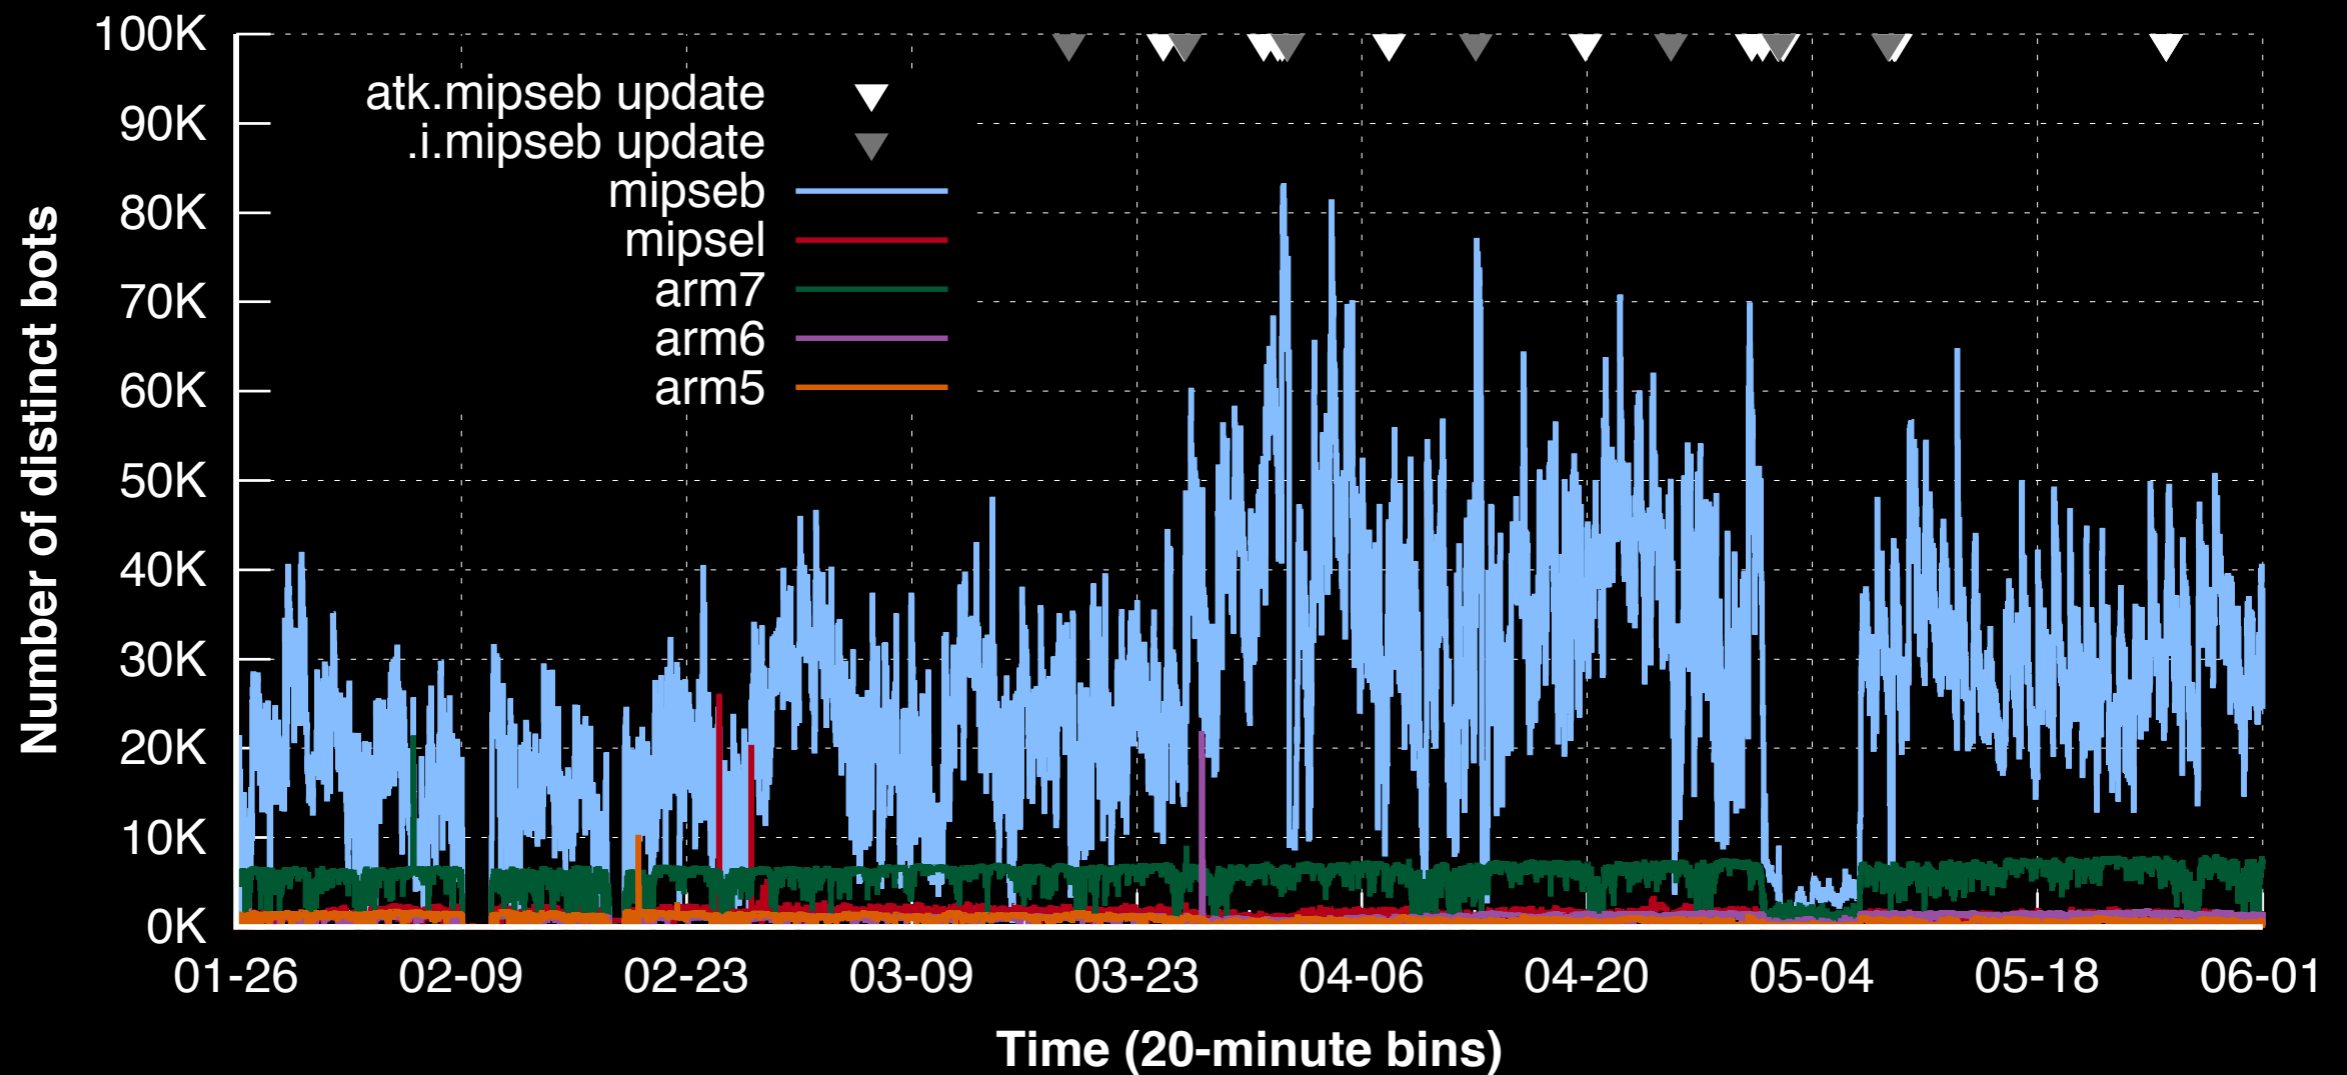

Mostly affected  
Mexico

The geographic makeup of IoT botnets can change rapidly

# What CPU architectures are most infected?

# What CPU architectures are most infected?

Devices overwhelmingly run MIPS

74.2% of bot devices are MIPS big-endian (mipseb)

# How does CPU architecture vary by country?

# How does CPU architecture vary by country?

# How does CPU architecture vary by country?

IoT botnets are highly heterogeneous across the world

# How does CPU architecture vary by country?

After the introduction of the GPON vulnerability

IoT botnets are highly heterogeneous across the world

# How does CPU architecture vary by country?

After the introduction of the GPON vulnerability

New vulnerabilities can lead to drastic changes in geography

# How does CPU architecture vary by country?

After the introduction of the GPON vulnerability

New vulnerabilities can lead to drastic changes in geography

# How does CPU architecture vary by country?

Mexico changed from primarily ARM to primarily MIPS

New vulnerabilities can lead to drastic changes in geography

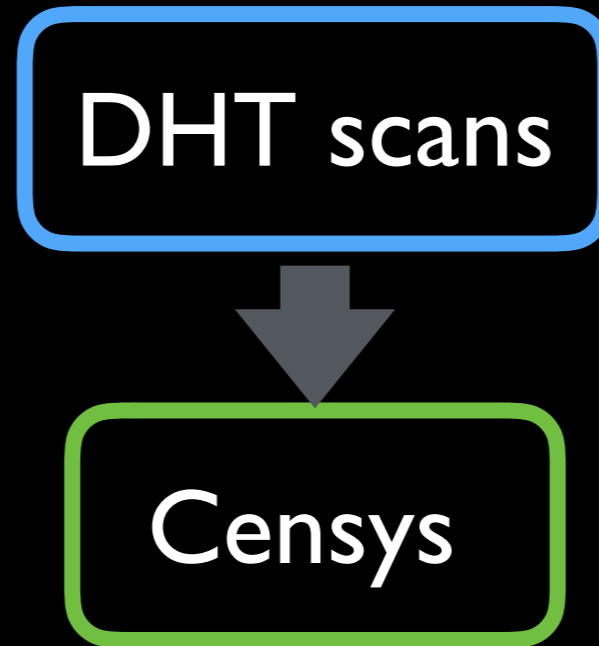

# How does CPU architecture vary by country?

Mexico changed from primarily ARM to primarily MIPS

New vulnerabilities can lead to drastic changes  
in geography and composition

# What devices are infected?

# What devices are infected?

DHT scans

Censys

No device information on over 80% of bot IP addresses

Of those identifiable:

0.8% MikroTik day before Chimay-Red  
80.3% day after

# How quickly does Hajime disseminate module updates?

% of mipseb bots hosting or looking up each file version

# How quickly does Hajime disseminate module updates?

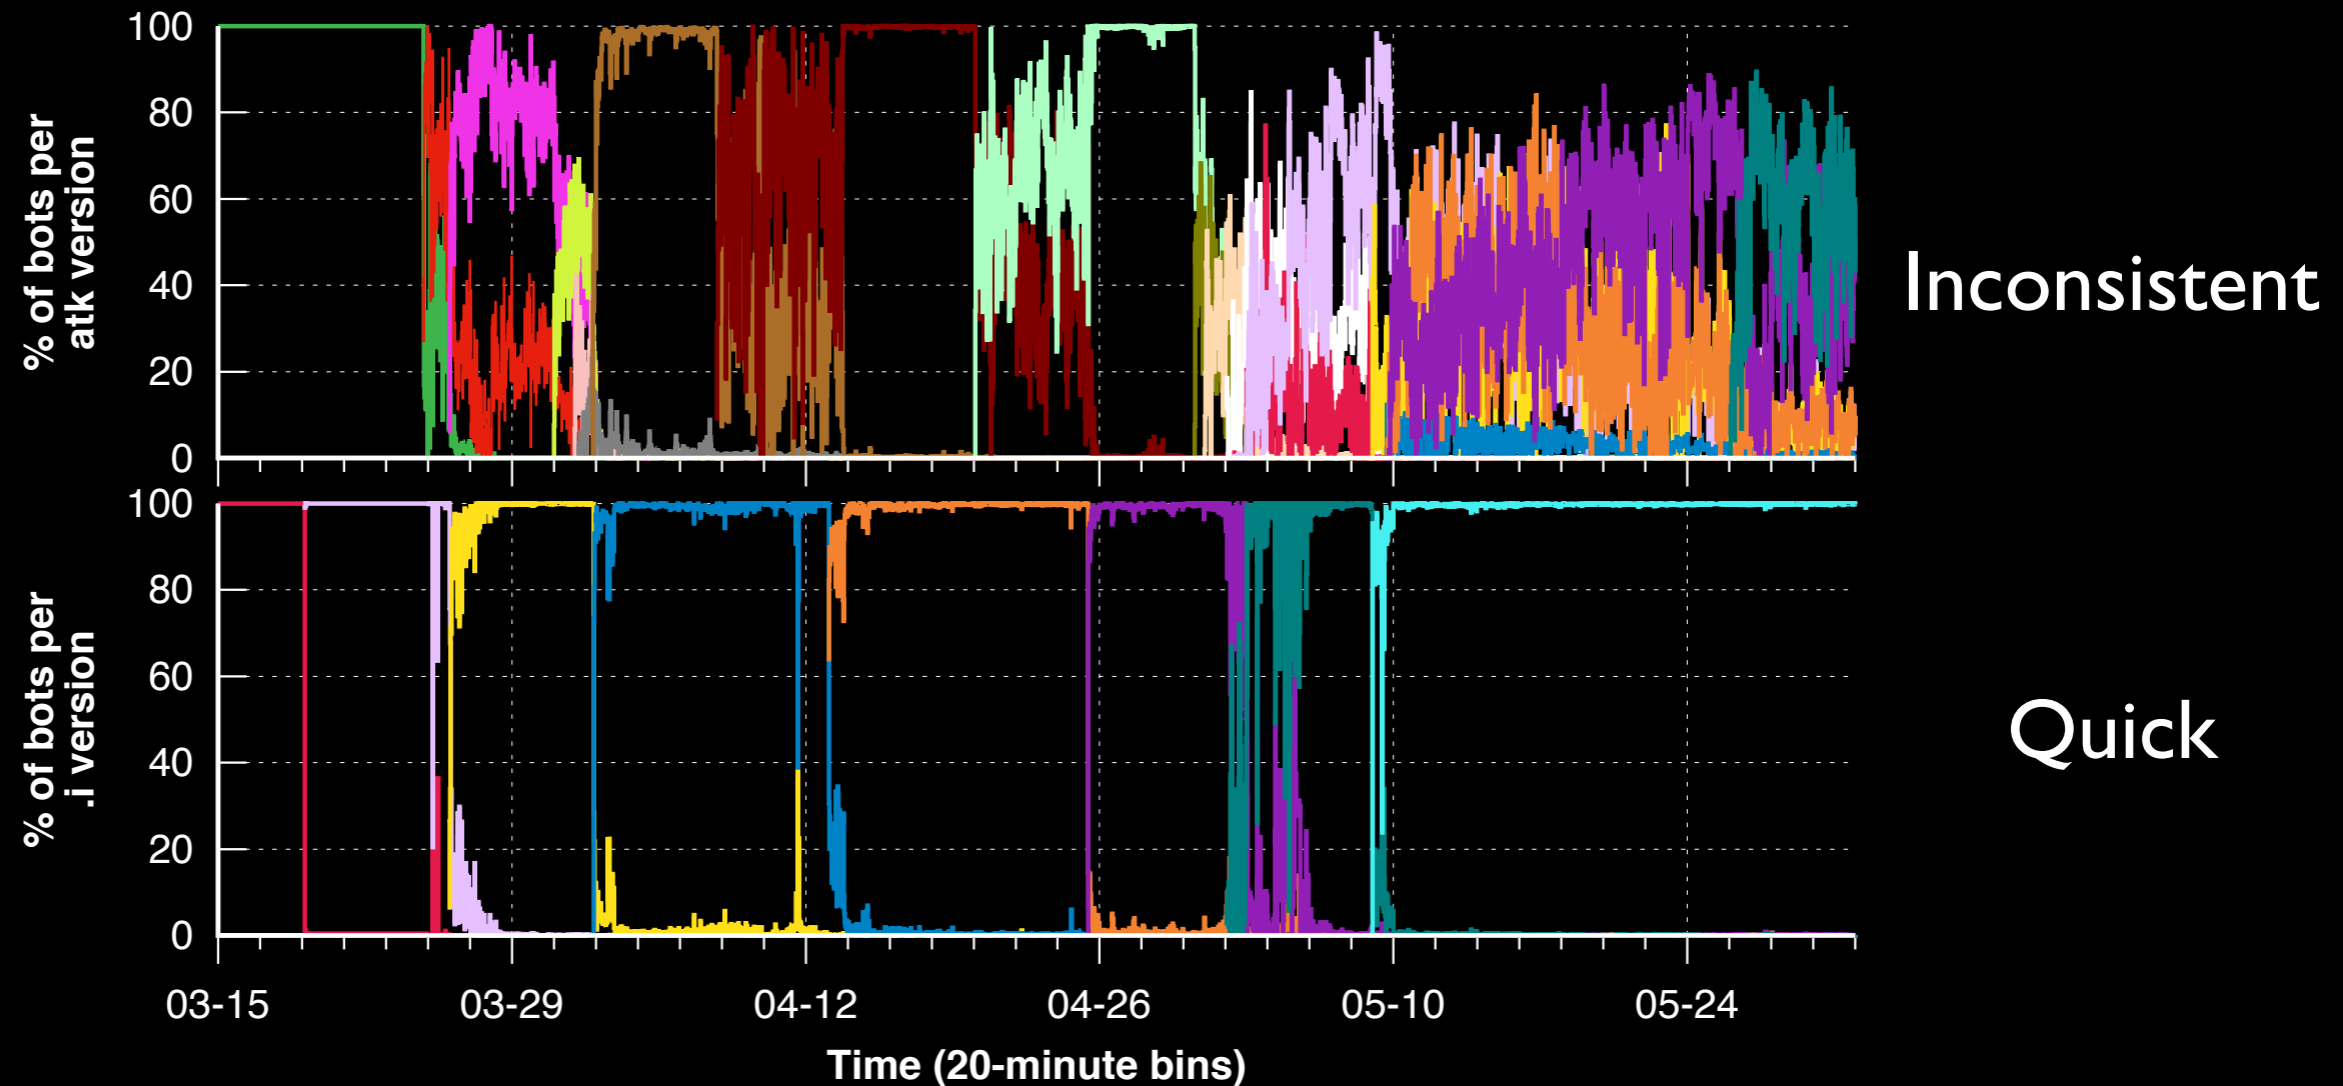

% of mipseb bots hosting or looking up each file version

Quick

# How quickly does Hajime disseminate module updates?

## DNS Backscatter

A sample of attack *attempts* worldwide

But only to *non-vulnerable hosts*

# DNS Backscatter: Mirai vs. Hajime

# DNS Backscatter: Mirai vs. Hajime

# DNS Backscatter: Mirai vs. Hajime

# Where is Hajime from?

Initial (test?) CWMP attack  
came from the **Netherlands**

# Where is Hajime from?

Initial (test?) CWMP attack  
came from the **Netherlands**

## Reverse eng

47 modules  
34 .atk, 13 .i

# Where is Hajime from?

Initial (test?) CWMP attack  
came from the **Netherlands**

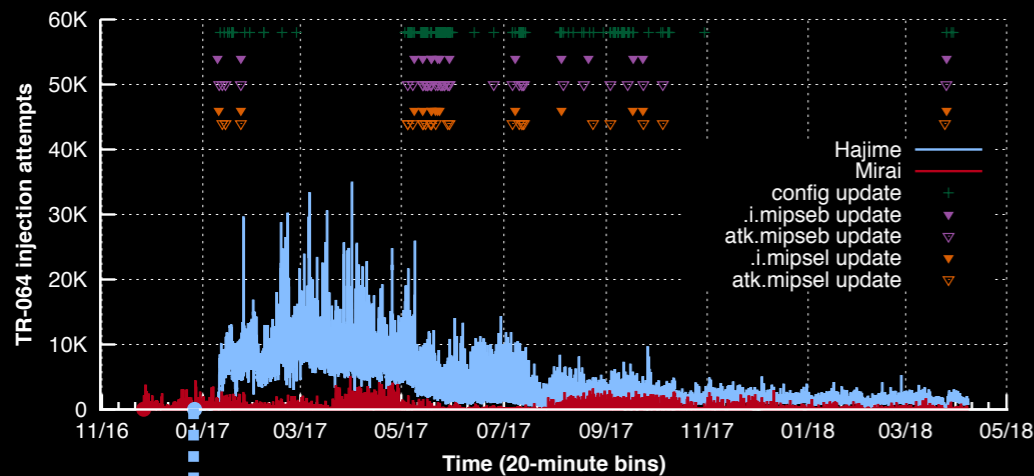

## Reverse eng

47 modules  
34 .atk, 13 .i

Hajime blacklists the same IP address as Mirai, plus:  
77.247.0.0/16    85.159.0.0/16    109.201.0.0/16

# Where is Hajime from?

Initial (test?) CWMP attack came from the **Netherlands**

## Reverse eng

47 modules  
34 .atk, 13 .i

Hajime blacklists the same IP address as Mirai, plus:

77.247.0.0/16    85.159.0.0/16    109.201.0.0/16

These have one ISP in common:  
NFOrce Entertainment (located in the **Netherlands**)

# Also covered in the paper

- Details on bot internals and exploits
- Analysis of bot churn
- Details on device fingerprinting
- Country-level analysis of CWMP DNS backscatter

# Measuring and analyzing Hajime

IoT botnets are  
resilient and large

40K steady

95K peak

IoT botnets have highly heterogeneous architectures

New vulnerabilities can lead to  
drastic changes in size, geography, and composition

Code and data coming soon: [iot.cs.umd.edu](http://iot.cs.umd.edu)
